

GBCC2019

Global Breast Cancer Conference 2019

Optimization of Radiotherapy for Bone Metastasis

Haeyoung Kim, MD, PhD

Sungkyunkwan University School of Medicine

SAMSUNG MEDICAL CENTER

- ✓ **General aspects of radiotherapy (RT)**
- ✓ **Optimization of RT**
 - **Dose and fractionation (Fx)**
 - **Extent of RT**
 - **Techniques of RT**
 - **Combination with systemic Tx**

- ✓ **General aspects of radiotherapy (RT)**
- ✓ **Optimization of RT**
 - **Dose and fractionation (Fx)**
 - **Extent of RT**
 - **Techniques of RT**
 - **Combination with systemic Tx**

Role of RT

- ✓ **Relief of bone pain**
- ✓ **Local control of disease**
- ✓ **Prevent pathologic fracture**

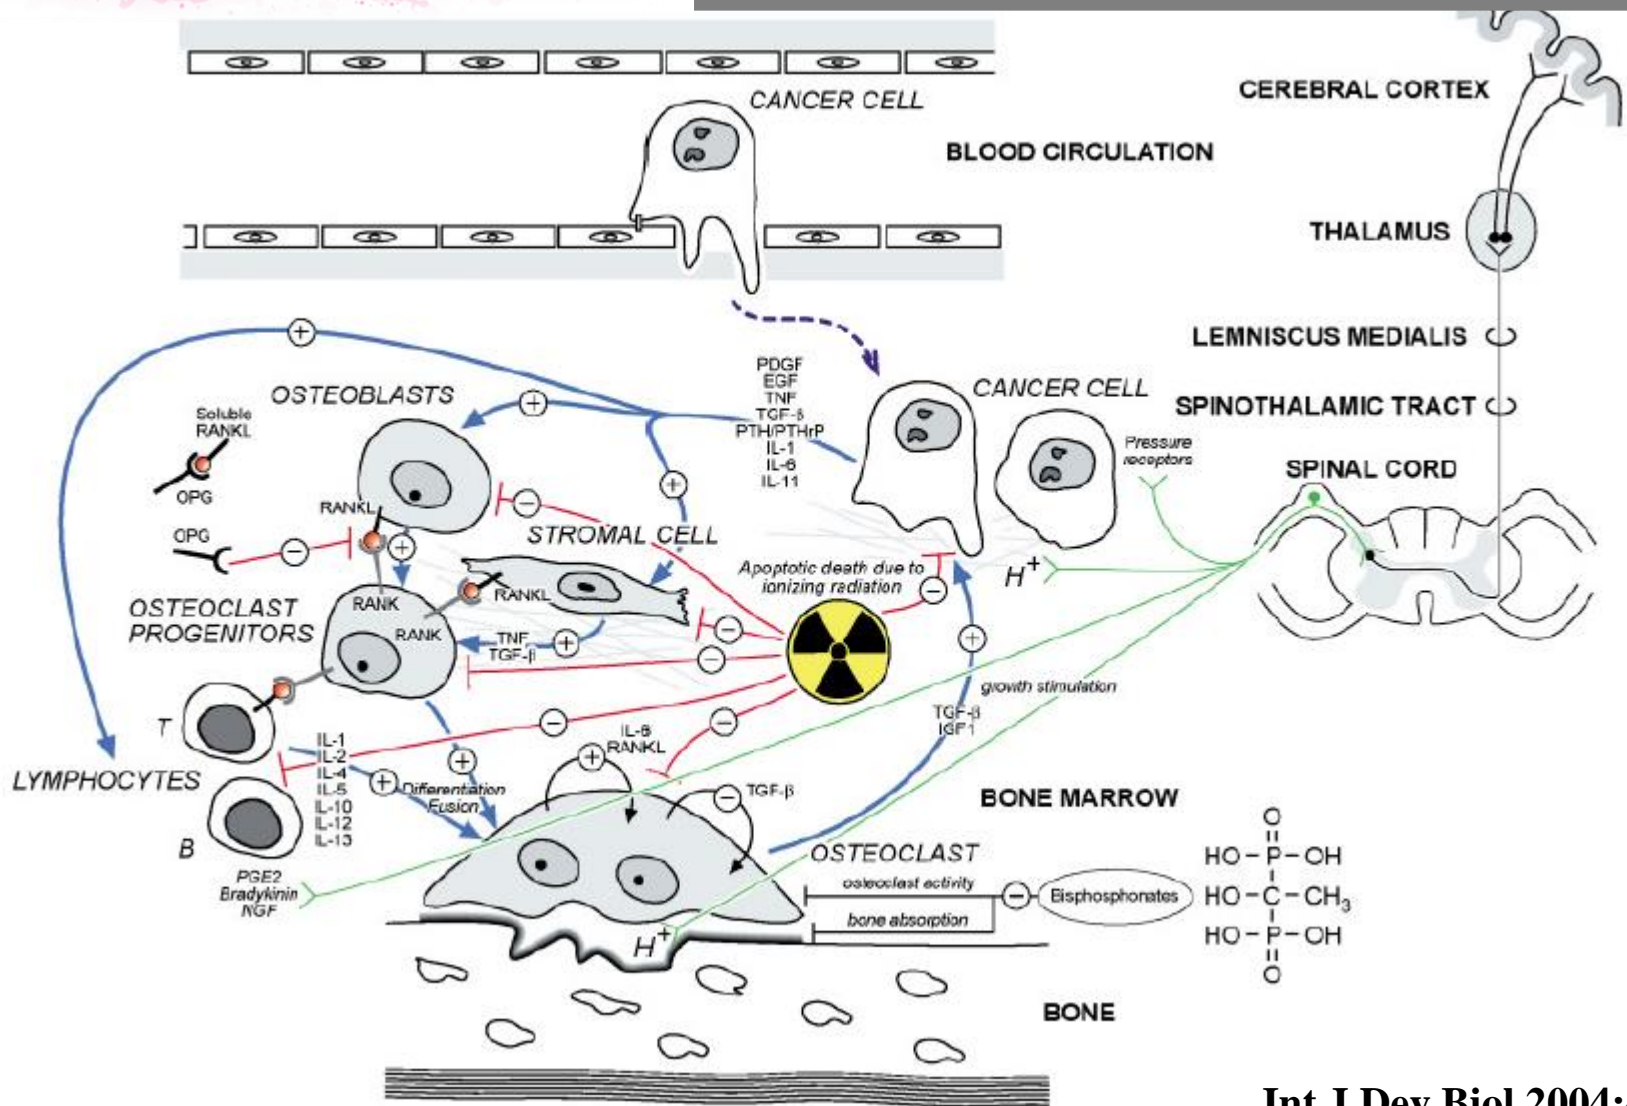

✓ Pain relief by RT

- **Overall response rate: $\approx 85\%$**
Partial relief (60-80%), complete relief (15-40%)
- **Occurs rapidly**
 $\geq 50\%$ of responders showing benefit within 1-2 weeks
- **Mechanism of pain relief is poorly understood**

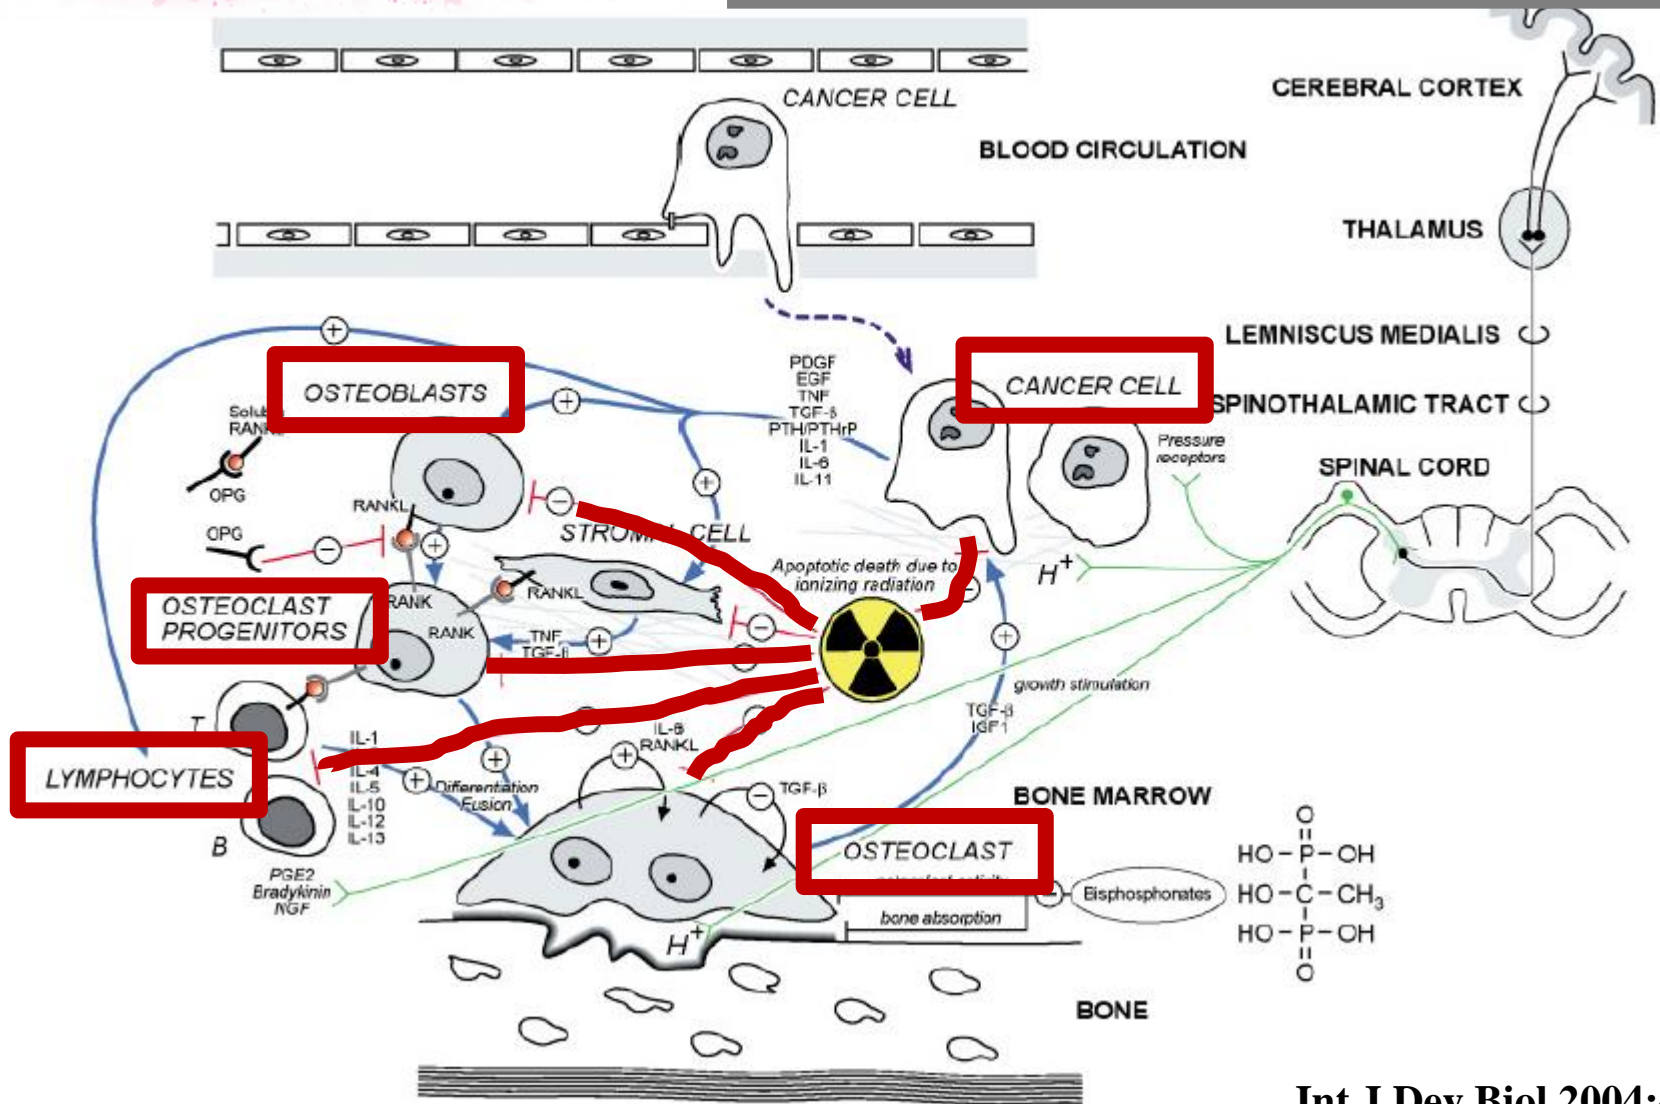

✓ Possible mechanism of bone pain

- Chemical mediators
- Pressure within the bone
- Microfractures
- Stretching of the periosteum
- Reactive muscle spasm
- Nerve root infiltration

Pain relief

Pain relief

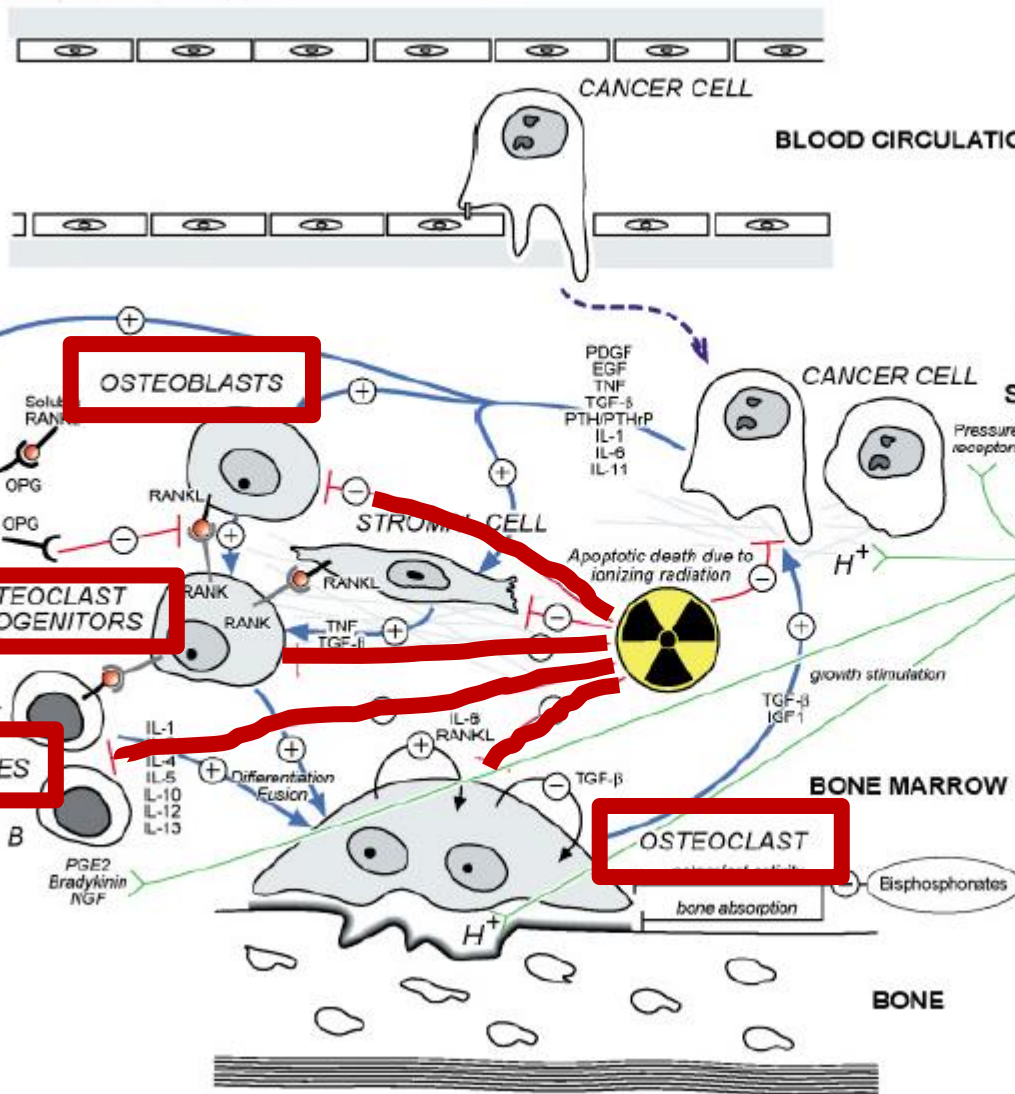

Pain relief

Mechanism of RT in reducing bone pain

- ✓ **Tumor shrinkage**
- **Pain diminish after a few sessions**
- **Unlikely to account for the early period of pain relief**

Pain relief

Mechanism of RT in reducing bone pain

- ✓ Reducing inflammatory cells
- Inhibits releasing chemical mediators
- ✓ Reducing osteoclast

Pain relief

RT

Time after RT

Within a few days

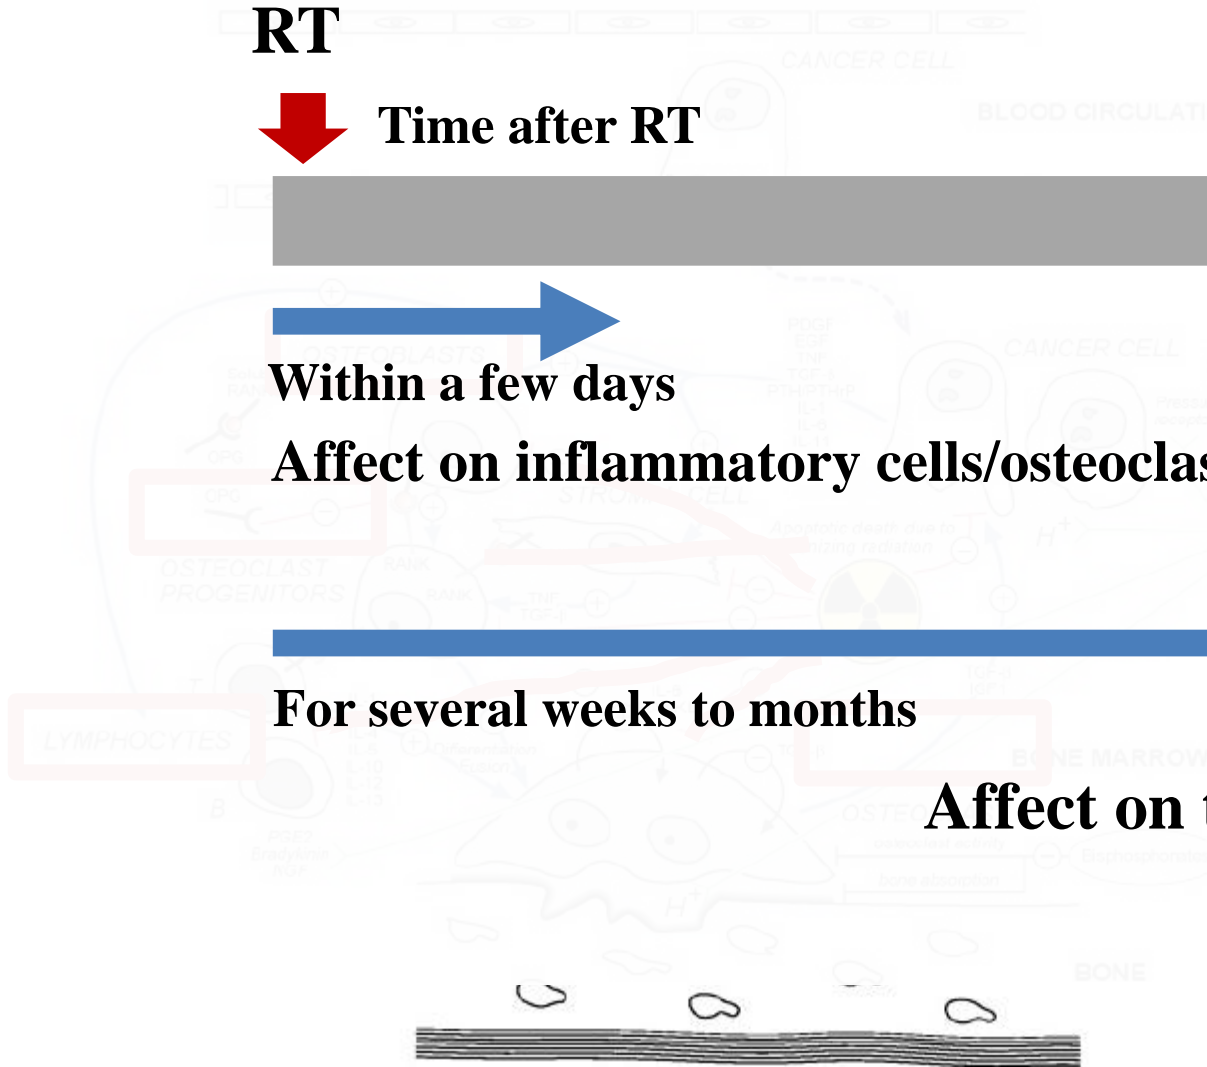

Affect on inflammatory cells/osteoclast

For several weeks to months

Affect on tumor cells

- Mechanism of RT in
- ✓ Reducing inflammatory cells
 - Inhibits releasing chemical mediators
 - ✓ Reducing osteoclast

Pain relief

RT

Time after RT

Within a few days

Affect on inflammatory cells/osteoclast

For several weeks to months

Affect on tumor cells

Pain relief

RT

Time after RT

Within a few days

Affect on inflammatory cells/osteoclast

For several weeks to months

Affect on tumor cells

- Mechanism of RT in
- ✓ Reducing inflammatory cells
 - Inhibits releasing chemical mediators
 - ✓ Reducing osteoclast

✓ Increase of bone density after RT

- in metastatic lesion, not in unaffected bone
- increasing density: multi-Fx > single Fx

Pre-RT

Post-RT 3months

Influencing factors

✓ In deciding RT schemes

Patient-related factors	Tumor-related factors	Logistic issues
Performance status	Histology of primary tumor	Family member's assistance
Clinical circumstances	Time elapsed from primary diagnosis to bone mets	Location of hospital
painful uncomplicated bone mets	Time of developing pain	Distance from home to hospital
Spinal cord compression	Time of neurologic deficits before RT	Cost of RT
Reirradiation		Reimbursement issues
Life expectancy		
Socioeconomic status		

Techniques of RT

✓ External beam radiotherapy (EBRT)

Conventional radiotherapy (CRT)

- Radiation dose to normal organs (spinal cord, bowel, etc)
- Difficult to deliver high-dose RT

Stereotactic body radiotherapy (SBRT) or Stereotactic ablative radiotherapy (SABR)

- Highly conformal
- Can deliver high-dose RT

Sites of RT

✓ Spine vs. peripheral bones

Life expectancy

✓ Estimating life expectancy

Model	No. of pts	Criteria for determining prognosis	Survival estimates
Chow et al. (2005, 2009)	840	Non-breast primary	Score 0-3 : 41% (12 Mo)
	395 (initial)	Metastases to other than bone only	
	NRF model	445 (validation)	KPS of ≤ 50
		Fatigue score 4-10	
		Appetite score 8-10 on ESAS	Score 5-6: 3% (12 Mo)
		Shortness of breath score 1-10 on ESAS	
Krishnan et al. (2013)	862	Type of cancer (lung, others vs. Breast/prostate)	Score 0-1: median survival, 19.9 mo
		ECOG (2-4 vs. 0-1)	
TEACHH model		Chemotherapy (≥ 2 vs. 0-1 course)	Score 2-4: median survival, 5 mo
		Hospitalization within 3 mo of RT (0 vs. ≥ 1)	
		Hepatic mets (present vs. absent)	Score 5-6: median survival, 1.7 mo

- ✓ General aspects of radiotherapy (RT)
- ✓ **Optimization of RT**
 - **Dose and fractionation (Fx)**
 - **Extent of RT**
 - **Methods of RT**
 - **Combination with systemic Tx**

Short vs. Long

✓ **Single vs. multiple Fx (Pain relief)**

- 26 randomized trials, **8 Gy/1 fx vs. 20 Gy/5 fx or 30 Gy/10 fx**
- In patients with uncomplicated painful bone mets
- Comparison on;
 - response rate (overall or complete response)
 - pathologic fracture rate
 - re-treatment rate

Study or Subgroup	Single Fraction		Multiple Fraction		Weight	Risk Ratio		Year	Risk Ratio

Short vs. Long

✓ Durability of pain relief

Pain relief for **single-fraction therapy**

Pain relief for **multi-fraction therapy**

Short vs. Long

- ✓ **In painful bone metastasis**
 - **Single Fx is equally effective** than **multiple Fx**
 - **Re-treatment rate: single Fx >> multiple Fx**
 - **Guidelines recommend**
 - : **Single Fx for relieving pain**

Short vs. Long

✓ Spinal cord compression

study		Fx schedules	Response
Rades et al.	Retrospective	5 fx schedules*	Improving motor function (26-31%) In-field recur at 2-year, higher in high-dose group
Rades et al.	Prospective	Short course (n=131) Long course (n=134)	1-year local control 61% (short) vs. 81% (long) (p<0.01) Improving motor function 37% (short) vs. 39% (long) (p=0.95)
Maranzano et al.	Phase III	8 Gy/1 fx (n=150) 16 Gy/2 fx (n=153)	No difference in response rate, duration of response, survival
Rades et al.	Retrospective	8 Gy/1 fx (n=121) 20 Gy/ 5x (n=121)	In-field Re-RT at 1-year 30% vs. 22% (p=0.11) Improving motor function 17% vs. 23%
Lee et al. (ICORG 0503)	Phase III	10 Gy/1 fx (n=38) 20 Gy/5 fx (n=38)	No difference in change in mobility at 5 weeks
Rades et al.	Phase III	20 Gy/5 fx (n=101) 30 Gy/10 fx (n=102)	Response rate (motor function) at 1 month: 87.2% vs. 89.6% Local progression free at 6 months: 75.2% vs. 81.8%

*5 schedules: 8 Gy/1 fx, 20 Gy/5 fx, 30 Gy/10 fx, 37.5 Gy/15 fx, 40 Gy/20 fx

†Short course: 8 Gy/1 fx, 20 Gy/5 fx, Long course: 30 Gy/10 fx, 37.5 Gy/15 fx, 40 Gy/20 fx

✓ Spinal cord compression

study		Fx schedules	Response
Rades et al.	Retrospective	5 fx schedules*	Improving motor function (26-31%) In-field recur at 2-year, higher in high-dose group
Rades et al.	Retrospective	Short course (n=124) Long course (n=113)	Improving motor function: 17-39% Local control: 75-81% (6 months), 61-81% (1-year) In-field Re-RT at 1-year 30% vs. 22% (p=0.11)
Maranzano et al.	Phase III	8 Gy/1 fx (n=150)	No difference in response rate, duration of response, survival
Rades et al.	Retrospective	8 Gy/1 fx (n=121)	In-field Re-RT at 1-year 30% vs. 22% (p=0.11)
Lee et al.	Phase III	10 Gy/1 fx (n=38)	No difference in change in mobility at 5 weeks
(ICORG 0503)		20 Gy/5 fx (n=38)	
Rades et al.	Phase III	20 Gy/5 fx (n=101)	Response rate (motor function) at 1 month: 87.2% vs. 89.6%
		30 Gy/10 fx (n=102)	Local progression free at 6 months: 75.2% vs. 81.8%

*5 schedules: 8 Gy/1 fx, 20 Gy/5 fx, 30 Gy/10 fx, 37.5 Gy/15 fx, 40 Gy/20 fx

†Short course: 8 Gy/1 fx, 20 Gy/5 fx, Long course: 30 Gy/10 fx, 37.5 Gy/15 fx, 40 Gy/20 fx

Short vs. Long

✓ Spinal cord compression

study		Fx schedules	Response
Rades et al.	Retrospective	5 fx schedules*	Improving motor function (26-31%) In-field recur at 2-year, higher in high-dose group
Rades et al.	Prospective	Short course (n=102) 20 Gy/5 fx (n=102)	Local progression free at 6 months: 61% (short) vs. 83% (long) (p<0.01) Improving motor function: 23% (short) vs. 29% (long) (p=0.95)
Maranzano et al.	Phase III	8 Gy/1 fx (n=150)	No difference in response rate, duration of response, survival
Rades et al.	Retrospective	8 Gy/1 fx (n=121) 20 Gy/ 5x (n=121)	In-field Re-RT at 1-year 30% vs. 22% (p=0.11) Improving motor function 17% vs. 23%
Lee et al. (ICORG 0503)	Phase III	10 Gy/1 fx (n=38) 20 Gy/5 fx (n=38)	No difference in change in mobility at 5 weeks
Rades et al.	Phase III	20 Gy/5 fx (n=101) 30 Gy/10 fx (n=102)	Response rate (motor function) at 1 month: 87.2% vs. 89.6% Local progression free at 6 months: 75.2% vs. 81.8%

- Outcomes were not affected by Fx schedules

- Short course RT is thought to be appropriate

*5 schedules: 8 Gy/1 fx, 20 Gy/5 fx, 30 Gy/10 fx, 37.5 Gy/15 fx, 40 Gy/20 fx

†Short course: 8 Gy/1 fx, 20 Gy/5 fx, Long course: 30 Gy/10 fx, 37.5 Gy/15 fx, 40 Gy/20 fx

Short vs. Long

✓ **Reirradiation**

Situations of reirradiation

- **Persistent or recurrent pain**
- **More than 1 month following EBRT**
- **spinal cord compression (-) fracture (-)**

Short vs. Long

✓ Reirradiation

- Efficacy (in meta-analysis of 15 studies)

Response	Rate %
Complete response	20% (70/355)
Partial response	50% (177/355)
Overall response	68% (438/645)

- Pain relieved, regardless of prior response

Short vs. Long

✓ **Reirradiation (Single vs. multi-Fx, phase III trial)**

- **8 Gy/1 fx vs. 20 Gy/5-8 fx**
- **8 Gy/1 fx is non-inferior than 20 Gy/5-8 fx**

Response	8 Gy/1 fx (n=258)	20 Gy/multi-fx (n=263)	P-value
Overall response	116 (45%)	134 (51%)	0.17
Complete response	35 (14%)	29 (11%)	
Partial response	81 (31%)	105 (40%)	

- **No difference in pathologic fracture, cord compression**
- **More side effects with 20 Gy (anorexia, nausea, vomiting)**

Short vs. Long

- ✓ **Single-Fx is equivalent to multi-Fx**
 - **Painful uncomplicated bone mets**
 - Spinal cord compression**
 - Reirradiation**
 - **Re-RT rate & local tumor control (?)**

Short vs. Long

✓ **RT at the end of life**

- **5-10% of cancer pts, 9-15% of pts with palliative RT**
- **Bone accounts for 30-70%**
- **Schedules: 30 Gy/10 fx (33-90%), Single Fx (0-59%)**
- **Pain response: 70% at 1 month, 63% at 2 months**
- **Median time to response: 2 wks**
- **Single Fx may be beneficial**

✓ Hemibody radiation

- For diffuse, widespread bone metastasis
- Lower hemibody (8 Gy/1 fx), lower hemibody (6 Gy/1 fx)
- Quick response; pain relief within 24-48 hrs, in 70-80%
- Pain relief persists $\geq 50\%$ of remaining life

With CRT

With tomotherapy

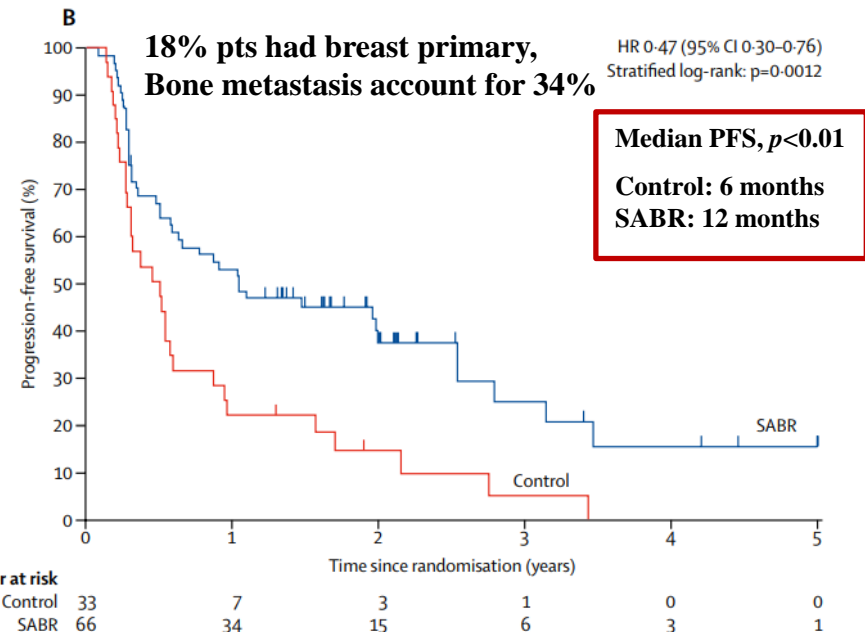

Extent of RT

✓ **SBRT for oligometastatic disease**

- Oligometastasis ($\leq 1-5$ visible mets), 1-10% of breast Ca.
- Bone: 30-45 Gy/3 fx or etc.

J clin oncol 2014;32:2902-2912

✓ Ablative radiotherapy

- High biological dose to the target, sparing normal tissue
- 5-8 times of the dose of CRT
- Typically less than 5 fx (24 Gy/1-2 fx, 27-45 Gy/3-5 fx)
- Indications

Minimal epidural disease

No spinal instability

Reirradiation

Good performance status

Long life expectancy

✓ Outcome of SBRT (local control)

Isolated L5 metastasis

24 Gy/1 fx SBRT

Metabolic CR at 3 months

Disease-free at 36 months

✓ Outcome of SBRT (local control)

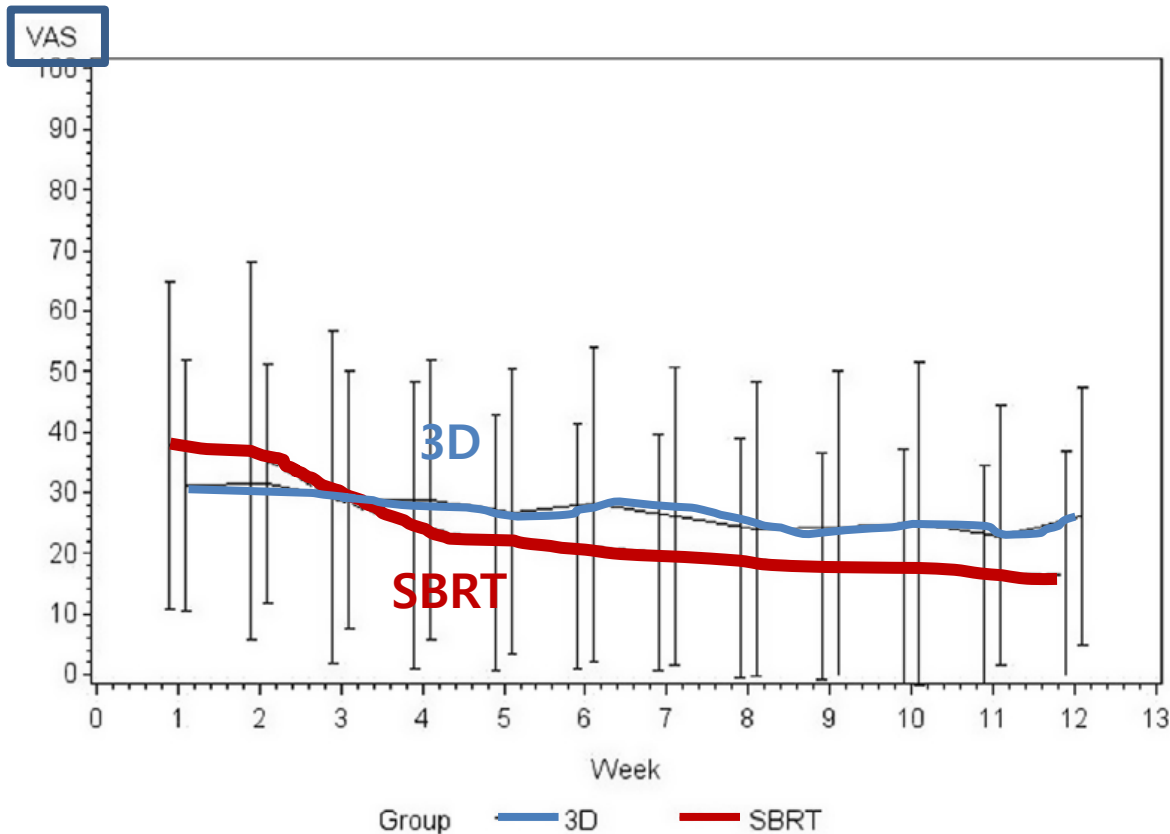

Setting	Dose/Fx	Local control rate
De novo	24 Gy/1 fx, 24 Gy/2 fx, 24-30 Gy/3 fx, 18-35 Gy/1-5 fx	81-95% at 1 year, 69-84% at 2 years
Postoperative	16-24 Gy/1 fx, 27 Gy/3 fx, 30 Gy/5 fx	80-92% at 1 year
Reirradiation	20-24 Gy/2 fx, 24-27 Gy/3 fx, 20-30 Gy/5 fx	66-93%

Complication

- **Radiation myelopathy, rare (< 1-3%)**
- **Vertebral compression fracture (10-40%)**
- **Pain flare (20-68%); can be reduced by prophylactic dexamethasone**

CRT vs. SBRT

✓ Outcome comparison (Pain relief, CRT vs. SBRT)

SBRT (24 Gy/1 fx)

- **Faster pain relief**
- **Longer duration of pain control**

**In comparison to CRT
(30 Gy/10 fx)**

Combination Tx

✓ With bone-targeted agents

- Radiologic response, bone density: RT alone < RT + bisphosphonate

Study	Patients (n), histologic type	Bisphosphonate	EBRT	Pain relief	Mild acute toxicity (%)	Repeat treatment rate	Investigator	Year	Reference
Prospective trials that compared treatment regimens									
Zoledronic acid with high- or reduced dose RT	100, breast cancer	Zoledronic acid, 4 mg monthly	30 Gy/10 Fx 15 Gy/5 Fx	95% 92%	ND	ND	Atahan	2009	105
Zoledronic acid plus single-dose 6- or 8-Gy RT	139, various histologic types	Zoledronic acid, 4 mg every 4–5 wk	8 Gy/1 Fx 6 Gy/1 Fx	ND (all patients improved)	22 14	NR	Manas	2008	107
Dose escalation of pamidronate with concurrent RT	42, various histologic types	Pamidronate, 90–180 mg monthly Pamidronate, 180 mg monthly None	30 Gy/10 Fx	100%	23	None	Kouloulis	2003	106
Prospective studies									
RT with concurrent zoledronic acid	18, renal cell cancer	Zoledronic acid, 4 mg monthly	NR	100% (44% CR, 56% PR)	NR	NR	Vassiliou	2009	121
Combination ibandronate and RT	45, various histologic types	Ibandronate, 6 mg monthly	30–40 Gy	100% at 3 mo; 85% at 6 mo	13	None	Vassiliou	2007	108
RT plus disodium pamidronate	33, breast cancer	Pamidronate, 180 mg monthly	30 Gy/10 Fx	100% (88% CR, 12% PR)	39	NR	Kouloulis	2002	109
Image assessment of combined RT and bisphosphonates	18, breast cancer	Pamidronate, 180 mg monthly	30 Gy/10 Fx	100% (77% CR, 23% PR)	39	NR	Kouloulis	2002	110

Summary

- ✓ **Single Fx is equivalent to multi-Fx RT**
- ✓ **SBRT can provide high local control**
- ✓ **Various factors should be taken into consideration**

✓ One scheme doesn't fit all

Palliative RT \neq low-dose RT or simple technique RT

8 Gy/1 fx, Hemibody

8 Gy/1 fx, using CRT

20 Gy/5 fx or 30 Gy/10 fx

24 Gy/1 fx, SBRT

More radical

Painful bone mets
Wide spread bone mets
Poor performance status
Impending cord compression
Residency distant from hospital

Require better local control
Residency close to hospital
Long life expectancy

Oligometastatic disease
Need more curative Tx
Long life expectancy
Good economic status

Q2. Radiotherapeutic
schedule ?

- 1. 8 Gy in 1 fraction with conventional planning
- 2. 30 Gy in 10 fractions with conventional planning
- 3. 20 Gy in 5 fractions with conventional planning
- 4. 30-45 Gy in 3-5 fractions with SBRT
- 5. Defer the decision to the radiation oncologist

Case I

- ✓ 78 year-old pts with breast cancer, first diagnosed in 2008.
- ✓ Diagnosed with metastatic breast cancer (multiple bone, lung mets) in 2015
- ✓ Pain in her lower back, ECOG performance status 3

✓ **Radiotherapeutic schedule ?**

- 1) 8 Gy in 1 fraction with conventional planning**
- 2) 30 Gy in 10 fractions with conventional planning**
- 3) 20 Gy in 5 fractions with conventional planning**
- 4) 30-45 Gy in 3-5 fractions with SBRT**
- 5) Defer the decision to the radiation oncologist**

✓ **Single fraction is underutilized**

	(%) of single fraction RT
Canada, Ontario	44%
Canada, British Columbia	49%
US, NCDB	7.4%
US, Johns Hopkins university	7.6%

✓ **In Korea***,

**Less than 2% of radiation oncologist opted to prescribe single fraction RT
According to a survey to 54 radiation oncologists in Korea.**

Case II

- ✓ **47 year-old pts with breast cancer, first diagnosed in 2012**
 - **Rt. Breast Ca. (pT2N0, ER+/PR+/HER2-)**
OP, RT, CTx, Tamoxifen (~2018)
- ✓ **Diagnosed with metastatic breast cancer (bone only) in November, 2018**

✓ **Radiotherapeutic schedule ?**

- 1) 8 Gy in 1 fraction with conventional planning**
- 2) 30 Gy in 10 fractions with conventional planning**
- 3) 20 Gy in 5 fractions with conventional planning**
- 4) 30-45 Gy in 3-5 fractions with SBRT**
- 5) Defer the decision to the radiation oncologist**

✓ Patients with favorable prognosis

- More intensified treatment might be helpful**

✓ **Optimization of radiotherapy:**
Stratification & modification !

8 Gy/1 fx, Hemibody

8 Gy/1 fx, using CRT

20 Gy/5 fx or 30 Gy/10 fx

24 Gy/1 fx, SBRT
