

# Pathological Issues in Preoperative Therapy

**Young Kyung Bae, M.D.**

Department of Pathology

Yeungnam University Medical Center

Daegu, Korea

영남대학교의료원

Yeungnam University Medical Center

# Content

---

- Pre-treatment diagnosis and assessment of predictive markers
- Factors associated with pathological complete response (pCR)
- Post-treatment histological assessment and grading of the therapy response
- Evaluation of lymph nodes

# Preoperative (neoadjuvant) therapy

- Increases breast conservation rates by surgical downstaging
- Pathologic response correlates with patients survival

	Neoadjuvant therapy (preoperative)	Adjuvant therapy (postoperative)
Purpose	↓ Tumor burden	↓ Disseminated tumor cells Stem cells
Endpoint	Pathological complete response (pCR)	Increase survival

# Pathologic complete response (pCR)

---

- The criteria for pCR are still controversial!
  - **No residual invasive cancer within both the breast and lymph nodes**
- About 60% of patients with no grossly detectable residual tumor after preoperative chemotherapy have persistent carcinoma histologically

# Histological diagnosis

---

- A **core needle biopsy (CNB)** of the primary tumor is preferred to fine needle aspiration
  - Type, histological grade, presence of lymphovascular invasion, ER, PR, HER2...
- Fine needle aspiration can be used to confirm ALN metastasis

**Tumor grade**

**Biomarker research**

**ER**

**HER2**

# ER, PR and HER2 on CNB

---

## Concordance rate between CNB and excision

	N	ER	PR	HER2
Park et al. (2009)	104	99%	97.1%	86.5%
Wood et al. (2007)	100	95.8%	90.3%	86.6%
Mann et al. (2005)	100	86%	83%	80%
Jacobs et al. (1998)	56	100%	NA	100%

# ER, PR and HER2 on CNB

---

- **Pre-treatment CNB**
  - ✓ Test for ER, PR
  - ✓ Test for HER2 (retest by ISH if any membranous staining is seen on immunohistochemistry)

# Pathologic features and response to neoadjuvant chemotherapy

---

Response	Features
Good	Ductal High grade ER- HER2+ High proliferation
Poor	Multicentric Low grade ER+ Low proliferation

# Molecular subtypes and pCR

Molecular classification	No	pCR (%)	
Luminal A/B subtype	30	7	
Normal breast like	10	0	
HER2+	20	45	
Basal subtype	22	45	$p < 0.001$

Clin Cancer Res 2005;11:5678-85

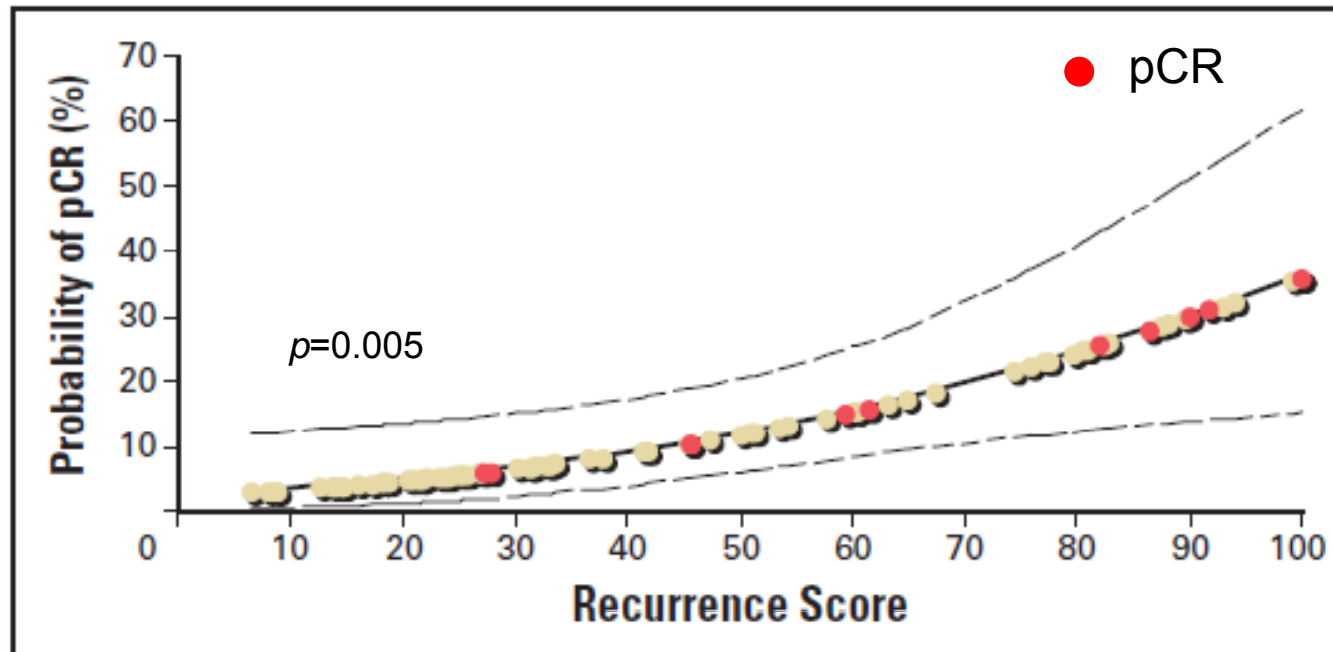

# Triple negative status and pCR

Regimens	No	pCR(%)		
		TNBC	Non-TNBC	<i>p</i>
FAC/FEC/AC	308	20	5	0.001
TFAC/TFEC	588	28	17	0.072
Single agent taxane	58	12	2	0.82
Other	164	14	7	0.33
<b>Total</b>	<b>1118</b>	<b>22</b>	<b>11</b>	<b>0.034</b>

J Clin Oncol 2008;26:1275-81

# Recurrence score and pCR

Gianni et al. JCO 2005;23:7265-77

# Breast cancer molecular profiles and tumor response to neoadjuvant doxorubicin and paclitaxel: The I-SPY TRIAL (CALGB 150007/150012, ACRIN 6657)

IHC	Distribution (n=190)	pCR (n=190)	<i>p</i>
HR+HER2-	48%	10%	
HR+HER2+	12%	32%	
HR-HER2+	12%	50%	
HR-HER2-	28%	33%	
Gene profile Intrinsic subtypes	Distribution (n=149)	pCR (n=144)	<i>p</i>
Luminal A	29%	2%	
Luminal B	19%	15%	
HER2-enriched	15%	52%	
Basal	32%	34%	
Normal-like	5%	43%	< 0.0001

Esserman et al. 2009 ASCO abstract #LBA515

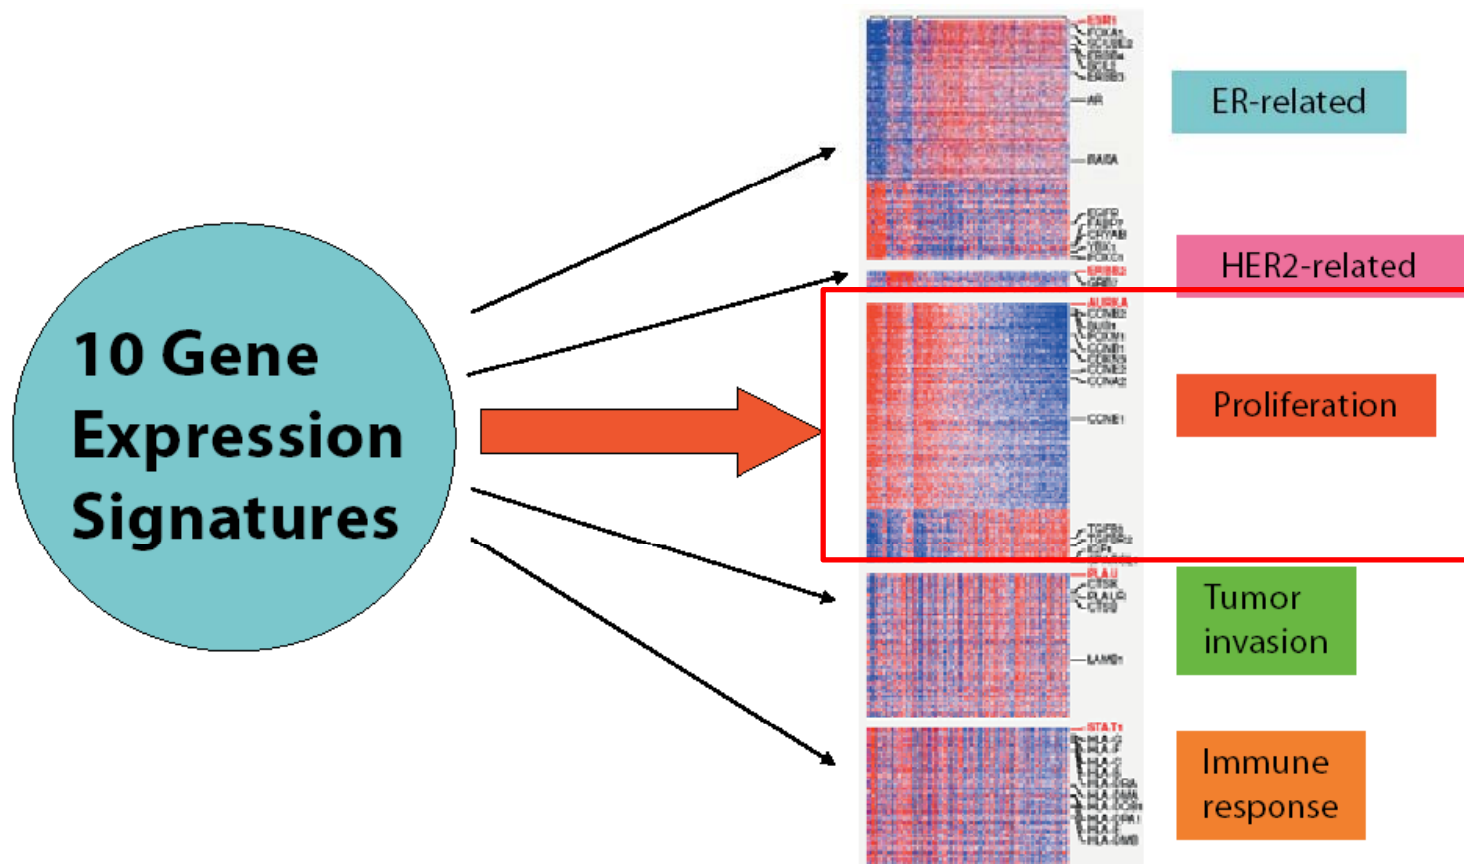

# The I-SPY TRIAL, continued

Gene profile	Distribution (n=149)	pCR (n=144)	<i>p</i>
<b>ROR-S</b>			
Low	26%	5%	
Moderate	38%	22%	
High	37%	40%	8.8 x 10 <sup>-4</sup>
<b>NKI 70</b>			
Good signature	9%	0%	
Poor signature	91%	27%	0.038
<b>Wound Healing</b>			
Quiescent	23%	6%	
Activated	77%	30%	0.0049
<b>p53 Mutation Gene Signature</b>			
Wild type	50%	11%	
Mutation	50%	38%	3.7 x 10 <sup>-4</sup>

Esserman et al. 2009 ASCO abstract #LBA515

# Proliferation-related genes are important in prognosis of breast cancer

# Histological assessment of therapy response

---

- Correlate with clinical and radiologic findings
- Sample widely to confirm pCR

# Tumor size

---

————— Tumor diameter

 Macroscopic tumor bed  
 Microscopic tumor foci

# Therapy effects on tumor cells

# Therapy effects on immunohistochemical markers

---

- No significant differences in ER, PR, and HER2 expression before and after neoadjuvant treatment
- Hormone receptor status changed in 5% of neoadjuvant chemotherapy groups due to tissue sampling
- Proliferation rates (Ki67 index and mitotic count) may be increased, decreased or remain unchanged
- A tendency to have increased immunoreactivity for p53

Virchows Arch 2005;446:489-96  
Am J Surg 2003;186:348-50  
Anticancer Res 1996;16:3105-10

# Grading of histological response

Pathologic complete response (pCR)

Residual disease (RD)

-  Residual tumor after chemotherapy
-  Original tumor before chemotherapy

# Residual cancer burden (RCB)

$$\text{RCB} = 1.4 (f_{\text{inv}} d_{\text{prim}})^{0.17} + [4(1-0.75^{\text{LN}}) d_{\text{met}}]^{0.17}$$

Primary tumor burden (size and cellularity) =  $f_{\text{inv}} \times d_{\text{prim}}$

$$d_{\text{prim}} = \sqrt{d_1 d_2}$$

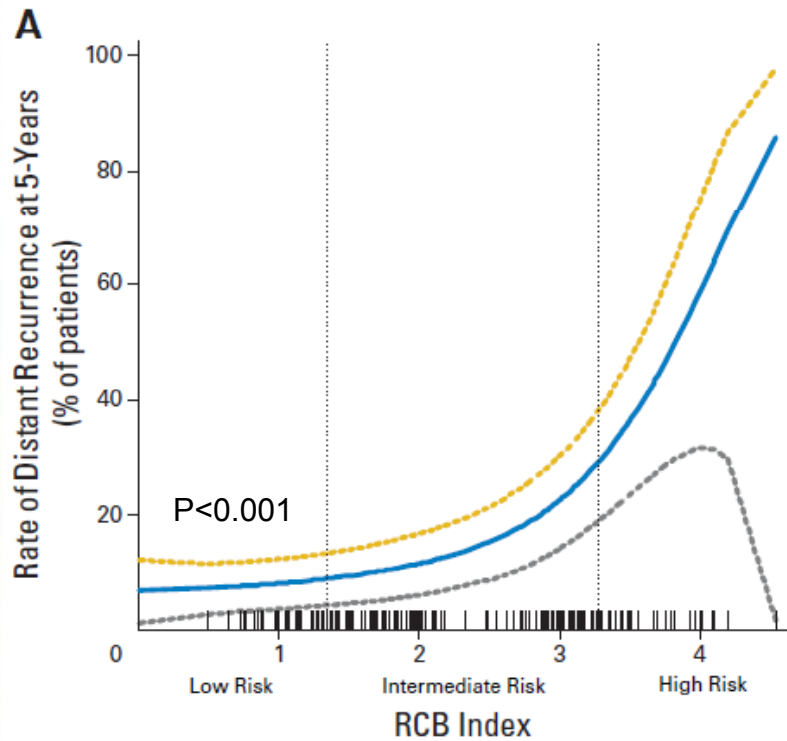

$$f_{\text{inv}} = (1 - (\% \text{CIS}/100)) \times (\% \text{CA}/100)$$

Axillary nodal burden (number and size) =  $4(1-0.75^{\text{LN}}) d_{\text{met}}$

# Residual cancer burden (RCB)

RCB 0 pCR, no invasive tumor  
RCB I minimal RD  
RCB II moderate RD  
RCB III extensive RD

## **Histopathological criteria for assessment of therapeutic response in breast cancer (2007 version)**

Masafumi Kurosumi · Sadako Akashi-Tanaka · Futoshi Akiyama ·  
Yoshifumi Komoike · Hirofumi Mukai · Seigo Nakamura · Hitoshi Tsuda ·  
(Committee for Production of Histopathological Criteria for Assessment of Therapeutic Response  
of the Japanese Breast Cancer Society)

- Grade 0 No response
- Grade 1 Slight response
  - (1a) Mild response: marked changes in  $<1/3$  of cancer cells
  - (1b) Moderate response: marked changes in  $1/3\sim 2/3$
- Grade 2 Marked response
  - (2a) marked changes in  $>2/3$
  - (2b) only a few remaining cancer cells
- Grade 3 Complete response
  - disappearance of all tumor cells

# Importance of histological grading of therapy response

---

- The amount of residual invasive cancer after preoperative therapy is an important prognostic predictor!!!

# Evaluation of sentinel lymph node

---

- Timing : before or after preoperative therapy
  - Pre-treatment SLN biopsy:  
Accurate assessment of initial nodal stage
  - Post-treatment SLN biopsy:  
Assessment of therapy response (pCR, RCB)  
No need for two-step operation

# Lymph node handling

- **Sentinel LNs**

- **Non-sentinel LNs**

A single representative H&E section without cytokeratin immunostaining

# Nodal status and clinical outcome

---

- Conversion to node-negative status after treatment
  - ER-negative tumor
  - pCR in the primary tumor
- The number of or the extent of involved lymph nodes is related to survival regardless of pCR or RD in the breast

# Summary

---

- Pre-treatment core needle biopsy provides full range of prognostic and predictive information
- Pathologic response in the breast and lymph nodes after preoperative therapy is an important prognostic factor
- A comprehensive and validated grading system of pathologic response is necessary to predict disease recurrence after preoperative therapy
- Pathologists take a role in the multidisciplinary approach to develop a new marker predicting response and resistance to therapy
